

Cayman Essential Care · Scheduling App · Zoom Integration Architecture

User-managed OAuth app. Meetings are created and cancelled on each clinician's own Zoom account. No Zoom SDK, webhooks, or in-client features are used.

1 · Connect: a clinician authorizes the app on their own Zoom account (OAuth 2.0 authorization-code flow). Access + refresh tokens are stored encrypted in the database and used only for that clinician's meetings.

2 · Create: when a virtual appointment is booked, the app calls **POST /users/me/meetings** with the clinician's token to create a scheduled meeting (waiting room on); the join link is saved on the appointment.

3 · Cancel: when the appointment is cancelled or deleted, the app calls **DELETE /meetings/{id}** to remove the meeting, so none are orphaned.

Scopes: meeting:write:meeting, meeting:delete:meeting. No other Zoom data is accessed; no webhooks, SDK, or in-client surfaces.
